François Viète's work on new algebra at the close of the 16th century was an important step towards modern algebra. In 1637, René Descartes published La Géométrie, inventing analytic geometry and introducing modern algebraic notation. Another key event in the further development of algebra was the general algebraic solution of the cubic and quartic equations, developed in the mid-16th ...

1) where  $\text{Fun}(t)$  is a predicate that is true for a relation  $t$  (in the mathematical sense) iff  $t$  is a function. It is usually required that  $R$  and  $S$  must have at least one common attribute, but if this constraint is omitted, and  $R$  and  $S$  have no common attributes, then the natural join becomes exactly the Cartesian product. The natural join can be simulated with Codd's primitives as follows ...

The six basic operators of relational algebra are the selection( $\sigma$ ), the projection( $\pi$ ), the Cartesian product ( $\times$ ) (also called the cross product or cross join), the set union ( $\cup$ ), the set difference ( $-$ ), and the rename ( $\rho$ ). These six operators are fundamental in the sense that none of them can be omitted without losing expressive power. Many other operators have been defined in terms of ...
