Predictive Microbiology Theory And Application

To date predictive microbiology has been concerned with predicting the rates of biological processes, particularly microbial growth and inactivation, almost exclusively using empirical models. More recently we have seen development of mechanistic models, such as the thermodynamically based temperature dependence model proposed by Corkrey et al. (2012) .

Predictive Microbiology: Theory And Application by Tom Ross

"Traditional" predictive microbiology is revisited with emphasis on temperature dependence. We interpret the temperature vs growth rate curve as comprising 11 regions, some well-recognised but others leading to new insights into physiological responses. In particular we are intrigued by a major disruption in the monotonic rate of inactivation at a temperature, slightly below the actual maximum temperature for growth.

Use of predictive microbiology in the food industry. The goal of predictive microbiology is to provide useful predictions about the microbial behaviour in food systems. Predictive microbiology combines "the disciplines of food microbiology, engineering and statistics" (Schaffner and Labuza, 1997). The goal of predictive microbiology is to provide useful predictions about the microbial behaviour in food systems.

Predictive microbiology focuses on the quantitative description and prediction of the behavior (growth, survival, and inactivation) of pathogenic and spoilage microorganisms in food products. A first section of this chapter focuses on modeling trends up to now. The classical primary and secondary model approach, used to describe growth and inactivation, as well as probabilistic models used to describe the growth/no growth (G/NG) boundary, are discussed.

For true shelf-life prediction, especially for refrigerated foods, knowledge of predictive microbiology is needed. Models that describe influences of temperature and water activity on microbial deterioration are compared and the square-root model is found to be the best based on the criteria of r^2 and mean square error.
