Naval architecture, the art and science of designing boats and ships to perform the missions and to meet the requirements laid down by the prospective owners and operators. It involves knowledge of mechanics, hydrostatics, hydrodynamics, steady and unsteady body motion, strength of materials, and design of structures. A good naval architect and ship designer must have experience in a number of fields of engineering, as well as in the field of engineering economics.

The course will start with an introductory phase identifying a generic framework for ship design using the classical design spiral. Ship mission, main dimension and powering requirements are defined using statistical methods. Hull form definition is based on the hydrostatics, hydrodynamics and ship general arrangement.

Naval architecture - Wikipedia

The hull is the foundation and the most essential part of the ship. The ship's hull form determines almost all of its main attributes; its water displacement capacity, its load carrying capacity, its resistance in water, the power needed to propel the ship, its ability to maneuver smoothly, and also its seaworthiness.
