Infection, Ischemia, and Amputation, An Issue of Foot and Ankle Clinics - E-Book (The Clinics: Orthopedics 3) 1st Edition, Kindle Edition by Michael Pinzur (Author), Mark S. Myerson (Author) Format: Kindle Edition

Amazon.com: Infection, Ischemia, and Amputation, An Issue ...

Successful limb salvage for infection or ischemia is dependent on the surgeon's ability to stabilize the acute process and select a level of amputation that will result in predictable healing potential and functional longevity. These patients often have multiple medical problems and significant soci ...

Amputation for infection or ischemia - PubMed

Objective: The Society for Vascular Surgery Wound, Ischemia, and foot Infection (WIFI) threatened limb classification has been shown to correlate well with risk of major amputation and time to wound healing in heterogeneous diabetic and nondiabetic populations. Major amputation continues to plague the most severe stage 4 WIFI patients, with 1-year amputation rates of 20% to 64%.

The Society for Vascular Surgery Wound, Ischemia, and foot ...

It's well known that the risk of amputation, directly correlates with the increasing infection severity, and that in the diabetic, population, infection is the major factor that prompts hospitalization, leads to amputation, and when combined with PVD, markedly increases the risk of amputation^{1,10}(see Table I).

The Wound, Ischemia and Foot Infection Classification ...

So, they created the WIFI (Wound, Ischemia, and foot Infection) Classification System to categorize these three major risk factors leading to amputation 1 Mills JL, Conte MS, Armstrong DG, et al. The Society for Vascular Surgery Lower Extremity Threatened Limb Classification System: Risk stratification based on Wound, Ischemia, and foot Infection (WIFI).

WIFI (Wound, Ischemia, and foot Infection) Classification ...

Risk stratification is based on three major factors that impact amputation risk and clinical management: Wound, Ischemia, and foot Infection (WIFI). The implementation of this classification system is intended to permit more meaningful analysis of outcomes for various forms of therapy in this

The Society for Vascular Surgery Lower Extremity ...

Worsening severity of ischemia likely further increases amputation risk in the presence of infection, although the severity of ischemia was not specified in Eurodiale. Despite the clear importance of infection in the pathway toward major limb amputation in patients with lower extremity wounds and PAD, infection is not even mentioned in the TASC, Rutherford, or Fontaine classification systems.

The Society for Vascular Surgery Lower Extremity ...

Surgical site infection after amputation is common and as well as increasing patient morbidity, can have negative effects on healing, phantom pain and time to prosthetic fitting . Risk factors for a stump infection include diabetes mellitus , old age and smoking, which are all common denominators amongst the amputee population [7] .
