Elementary algebra - Wikipedia

Q2.3) Explain the relationship between the terms exact differential and state function. In order for a function $f(x,y)$ to be a state function, it must be possible to write the total $\left(\frac{\partial f}{\partial x} \right)_y \left(\frac{\partial f}{\partial y} \right)_x$ differential df in the form $df = \left(\frac{\partial f}{\partial x} \right)_y dx + \left(\frac{\partial f}{\partial y} \right)_x dy$. If the form df as written exists, it is $\left(\frac{\partial f}{\partial x} \right)_y \left(\frac{\partial f}{\partial y} \right)_x$

Equation (21) is a series representation of all the expansion coefficients in terms of 0 for the power series solution to equation (13). For large values of y , n is also very large. The ratio of $n + 1$ and n (from formula (21) for the coefficients of the power series expansion above) is very close to 1. Here we have a problem,
