Trauma-Focused Cognitive Behavioral
Therapy (TF-CBT) was originally
designed for children, adolescents, and
non-offending caregivers facing the
crisis of child sexual abuse. Early
investigations evaluating the potential
benefits of this model in individual and
group formats were conducted via
pre-post and quasi-experimental designs
(Deblinger et al., 1990; Stauffer &

The Science Behind PTSD

Symptoms: How Trauma Changes The Brain

There remains a need for safe, effective and feasible preventive treatments that can be administered in the early aftermath of trauma. Cognitive science research opens some new potential avenues for prevention, by focusing on intrusive memories of trauma (rather than several symptom clusters at once) and seeking to precisely modify this target outcome.

We propose the utility of developing a 'cognitive vaccine' to prevent PTSD flashback development following exposure to trauma. Our theory is based on two key findings: 1) Cognitive science suggests that the brain has selective resources with limited capacity; 2) The neurobiology of memory suggests a 6-hr window to disrupt memory consolidation.
